

Charter of the Internet good use July 2022

Symmetric DSL offers the same speeds in both directions (download and upload). Indicated speeds are guaranteed. Clients with this type of connection access a secure, standalone virtual local area network (VLAN) which is part of the Venues' local area network (LAN). A RJ45 connector is required to connect to this network.

Note that connection speeds vary according to the number of devices using the network. Too many users can cause network saturation, which can cause significant delays in connecting to the network.

The grids below are designed to help you choose the connection that's best suited to your needs as a user.

Single station SDSL
